1.Armstrong Number.

```
public class Armstrong {
  public static void main(String[] args) {
    double digit = 0;
    int num = 153;
    int num1 = num;
    int tempog = num;
    int og = num;
    int base;
    int exponent = 0;

    while (num1 > 0) {
      num1 = num1 / 10;
      exponent++;
    }
    while (tempog > 0) {
      base = tempog % 10;
      tempog = tempog / 10;
      digit = Math.pow(base, exponent) + digit;
    }

    if (og == digit) {
      System.out.println("The Number is Armstrong Number");
    } else {
      System.out.println("The Number is Not a Armstrong Number");

    }
  }
}
```

2.Print All divisors.

```
package BasicPrograms;
public class AllDevisors {
  public static void main(String[] args) {
    int num=56;
    int i=1;
    while(i<num){
      if(num%i==0){
        System.out.println("Divisor : "+i);
      }
      i++;
    }
  }
}
```

3.Fibonacci Series.

```
public class Fibonacci {
   public static void main(String[] args) {
      int i = 1;
      int term=10;
      int newnum=1;
      int pastnum=0;

      while (i <= term) {
         int gnum=newnum+pastnum;
         System.out.print(pastnum+" ");
         pastnum=newnum;
         newnum=gnum;
         i++;
      }
   }
}
```

4.Prime Number.

```
public class PrimeCheck {
   public static void main(String[] args) {
      int num = 1001;
      int i = 2;
      int count = 0;
      if (num == 0) {
         System.out.println("Not Prime this is ZERO");
      }
      if (num == 1) {
         System.out.println("Not Prime this is ONE");
      }
      while (i < num) {
         if (num % i != 0) {
            count++;
         }
         i++;
      }
      if (count != num - 2) {
         System.out.println("Not Prime");
      } else {
         System.out.println("Prime");

      }
   }
}
```
